

**METHODS AND APPARATUS FOR
VOICE ACTIVATED AUDIBLE ORDER SYSTEM**

Abstract of the Disclosure

Systems, apparatus and methods for a voice activated delivery of orders to the
5 restaurant food preparers. Food orders from customers are entered in a point-of-sale
(POS) register. The restaurant worker speaks an order which is received by a speech-to-
text search, resulting in a conversion into speech of a POS entry. The restaurant worker
receives an audible synthesized voice reciting the POS entry. As a result, the restaurant
worker is not required to view a visual display. The preferred embodiments include
10 wireless communication with the restaurant worker so that the worker may move freely
while speaking voice commands and receiving the synthesized voice orders.
